

SRS Offshore Brace (After Guy) Donut

Sydney Rigging Specialists have designed the shape of their tapered donut to bear snugly on the spinnaker pole beak yet fall away from the pole end quickly & easily when the pole is tripped away from the spinnaker tack in a gybe or early stow of the spinnaker pole.

In order to withstand the constant movement of the clip on the tack end of the spinnaker (which eventually chafes through the rope at the splice cradle (resulting in the brace failing) the offshore donut has a stainless low profile loop spliced integrally into the donut that the clip bears on. This eliminates the chafe problems caused by the constant movement of the clip.

The Off Shore Donut is made to suit 8mm, 10mm, 12mm, 14mm & 16mm diameter rope. Custom sizes can be made on order.
